For this quarter’s final project, I would like you to read the following two papers and to write a report.

For the second paper, the Math Review by Tammo tom Dieck is very informative.

This report should be about five pages in length answer the following questions:

1.) What are the main results of these paper?

2.) Why are they interesting and/or important? Why did I group these two papers together?

3.) Are there any interesting constructions in this paper? If so, what are they and what do they tell us?

4.) What was new and important about these papers? In other words, what is the key idea that raises this paper above routine work?

Note that I am not asking for a recapitulation of the proofs of this paper. While some of the key arguments may be included in your discussion, what I really want is a discussion of core ideas.
